Jornaling

Prompt for Replit: Build Advanced Journaling System

We need to implement a **Journaling Section** in the app with text writing, image upload, OCR conversion, calendar integration, emoji tagging, and intelligent day-type categorization.

The system must be scalable and cleanly structured.

1️⃣ Core Journaling Features

1.1 Create Journal Entry

For each calendar day, user should be able to:

- Write text (long-form journaling)
- Edit text
- Delete entry
- Save draft (optional)
- Attach one or multiple photos

2️⃣ Image Upload + Text Extraction (OCR Feature)

If user uploads an image (example: handwritten notes):

System must provide:

Option:

“Convert Image to Text”

When clicked:

- Use OCR to extract written text from image.
- Convert extracted text into:
  - Clean paragraph format
  - Structured readable content
- Allow user to:
  - Edit extracted text
  - Append to journal
  - Replace existing text

Important:

- Do NOT auto-overwrite journal.
- User must confirm before inserting extracted text.

3️⃣ Day Classification System

When user opens a particular date:

They must choose a “Day Type”.

There are 35 predefined Day Types grouped into categories.

📂 Categories & Day Types

1️⃣ Focus & Productivity Based Days

1. Deep Focus Day
2. High Productivity Day
3. Disciplined Execution Day
4. Very Focused Day
5. Slightly Distracted Day

6. Unfocused / Scattered Day

2️⃣ Positive but Stable Days

1. Happy Day
2. Peaceful Day
3. Productive Day
4. Motivated Day
5. Connected Day
6. Grateful Day

3️⃣ Business & Learning Days

1. Massive Learning Day
2. Strategic Thinking Day
3. Skill-Building Day
4. Breakthrough Business Day
5. Slow Progress Day
6. Stagnant Business Day

4️⃣ Peak Positive Days

1. Best Ever Day
2. Life Achievement Day
3. Dream Come True Day
4. Very Happy Day
5. Unforgettable Day
6. Special Day
7. Proud of Myself Day

8. Victory Day

5️⃣ Neutral / Mixed Days

1. Normal Day
2. Confusing Day
3. Overthinking Day
4. Tiring Day

6️⃣ Negative Days

1. Sad Day
2. Very Sad Day
3. Regretful Day
4. Worst Day
5. Emotionally Drained Day

4️⃣ Custom Day Option

If user does not want predefined options:

Add:

- Custom Day

User can:

- Create custom day name
- Assign emoji
- Save it

Custom days must be stored per user.

5️⃣ Emoji System

Each Day Type must have:

- Default emoji
- Option to change emoji

Emoji behavior across calendar views:

Yearly View

- Only show emoji icon.
- No text.
- Clicking emoji → open full journal entry.

Monthly View

- Show Day Name (example: “Massive Learning Day”).
- Clicking opens entry.

Weekly View

- Show:
  - Emoji
  - Day Name
- Clicking opens entry.

6️⃣ Smart Reordering System (Very Important)

The Day Type selection list must auto-reorder based on usage frequency.

Logic:

- Most frequently selected Day Type → appear at top.
- Least used → move down.

- Custom days follow same logic.
- Recalculate ordering dynamically.

This improves UX efficiency.

7️⃣ Calendar Integration

Calendar Views Required:

- Daily
- Weekly
- Monthly
- Yearly

Behavior:

Daily View:

- Full journal content
- Editable

Weekly View:

- Emoji + Day Name visible

Monthly View:

- Day Name visible

Yearly View:

- Emoji only
- Clean minimal UI

Clicking any day → opens journal detail page.

8️⃣ Database Requirements

For each journal entry store:

- user_id
- date
- day_type_id
- custom_day_name (if any)
- emoji
- journal_text
- image_urls
- extracted_text (if OCR used)
- created_at
- updated_at

For day types:

- default list
- usage_count (per user)

9️⃣ Performance & UX Requirements

- Images stored securely.
- OCR processing async (show loading indicator).
- Calendar must load quickly.
- Avoid heavy queries in yearly view.
- Cache day summaries.

🔟 Future Scalability (Structure Only)

Prepare backend to support:

- Journal analytics (emotion tracking graph)
- Mood trend over year

- Productivity vs emotion correlation
- Export journal as PDF
- Private lock journal (PIN protected)

Do not implement yet, but structure code modularly.
