Knowledge about features

Prompt for Replit: Modify “Know More About Consistency System” to Use YouTube Hosting

We need to update the **Know More About Consistency System** section.

Important constraint:

All videos will be uploaded to **YouTube**, not stored in our app.

The app must not store large video files.

The system must integrate YouTube efficiently while keeping feedback inside the app.

1️⃣ Core Video Hosting Logic

Videos will be:

- Uploaded privately or unlisted on YouTube.
- Stored only as YouTube URLs in our database.
- Embedded inside the app using YouTube embed iframe.

We must NOT store video files in our server.

2️⃣ Video Storage Structure

Database table:

videos:

- id
- title
- description

- category
- youtube_url
- thumbnail_url (optional)
- duration
- created_at
- updated_at

Store only the YouTube link.

Example:

https://www.youtube.com/watch?v=VIDEO_ID

From that extract VIDEO_ID for embed.

3️⃣ Video Display Options

We need two possible viewing modes:

Option A (Recommended): Embedded Player Inside App

When user clicks video:

- Open internal page.
- Embed YouTube player using iframe.
- Do not redirect user outside app.
- Disable suggested videos if possible using:
  - rel=0 parameter
  - modest branding mode

Embed format:

https://www.youtube.com/embed/VIDEO_ID?rel=0&modestbranding=1

This keeps user inside app and improves retention.

Option B (Fallback): Open in YouTube

If embedding fails:

- Open YouTube link in new tab.
- Use target="_blank".

4️⃣ Feedback System (Very Important)

Even though video is hosted on YouTube:

All feedback must stay inside our app.

Under the embedded video, add:

Submit Feedback

Options:

- Ask a Doubt
- Suggest Improvement
- Report Issue
- Request Feature

User types message → Submit.

Rules:

- Users can only see their own feedback.
- Users cannot see other users' feedback.
- Admin can see all feedback.
- Feedback stored in internal database.

This ensures:

- Feedback control
- No public comment exposure

- Private suggestion system

5️⃣ Admin Upload Process

Admin workflow:

1. Upload video to YouTube.
2. Copy YouTube link.
3. Go to Admin Panel.
4. Add new video entry:
    - Title
    - Description
    - Category
    - YouTube URL
    - Thumbnail (optional)

System automatically:

- Extract VIDEO_ID
- Generate embed link
- Display properly

6️⃣ Security & Privacy Considerations

If using YouTube:

- Use Unlisted videos (not Public).
- Disable YouTube comments.
- Disable public likes.
- Avoid exposing channel recommendations.

We control feedback inside app only.

7️⃣ Performance Optimization

- Lazy load video iframe.
- Load thumbnail first.
- Load iframe only when user clicks “Play”.
- Avoid autoplay.
- Optimize for mobile.

8️⃣ Future Scalability

Structure system so that later we can:

- Replace YouTube with:
  - Vimeo
  - Private CDN
  - Self-hosted streaming
- Add video completion tracking
- Track watch percentage
- Track most watched videos

Design video system as provider-based:

video_provider:

- youtube
- vimeo
- internal

Currently default = youtube

9️⃣ UI Structure

Video Page:

- Embedded player
- Title
- Description
- Submit Feedback section
- Related videos

Keep it clean and distraction-free.
