Grow Together

Part-1

We need to build a new section inside the Consistency System app called:

👥 Compare With Friends

This feature allows users to:

- Invite friends
- Connect with them
- Compare productivity data
- Track performance differences
- View daily, weekly, and monthly comparisons
- Compare multiple people at once

This must be scalable and privacy-controlled.

1️⃣ Core Concept

Users can invite:

- Friends
- Family members
- Known people
- Anyone with invite link

After invitation is accepted:

- Both users can compare their productivity data.

Users can compare:

- 1 person

- 5 people
- 10 people
- 20+ people

System must support multiple comparisons.

2️⃣ Friend Invitation System

Users can:

- Generate invite link
- Share link
- Accept friend request

When accepted:

- Both users become “Connected”
- They appear in each other’s comparison list

Database:

friends:

- id
- user_id
- friend_id
- status (pending / accepted / rejected)
- created_at

3️⃣ Two Types of Comparison

We need TWO layers of comparison:

🟢 TYPE 1: High-Level Comparison (Averages)

Users can compare:

Daily Average Score

User A vs User B

Weekly Average Score

User A vs User B

Monthly Average Score

User A vs User B

Also:

- Lifetime Average Score
- Current Streak
- Longest Streak
- Current Level

Display:

- Side-by-side comparison cards
- % difference
- Green/Red indicators
- Progress bars

Example:

Daily Avg:

You: 72%

Friend: 65%

Difference: +7%

🔵 TYPE 2: Deep Daily Comparison (In-Depth)

When user clicks “Deep Compare” on a specific date:

System compares:

For that specific day:

1. Daily Score %
2. Task Completion %
3. Good Habits %
4. Bad Habits %
5. Hourly Completion % (if enabled)
6. Time of First Task Completion
7. Time of Last Task Completion
8. Total Tasks Completed
9. Productivity Duration (optional future)

Display:

Comparison table:

Metric | You | Friend | Difference

Color code:

- Green = Better
- Red = Lower
- Neutral = Equal

4️⃣ Multi-Friend Comparison

User must be able to:

- Select multiple friends

- Compare against:
  - One friend
  - Multiple friends
  - All friends

Display as:

Leaderboard style:

Rank by:

- Daily Average
- Weekly Average
- Monthly Average
- Streak

Allow filter:

- Today
- This Week
- This Month
- Custom Date

5️⃣ Visualization Requirements

Must include:

- Bar comparison charts
- Line graph comparison (weekly trend)
- Radar chart (optional advanced)
- Progress comparison rings
- Rank indicators

UI must be:

- Clean
- Fast
- Easy to understand
- Mobile responsive

6️⃣ Privacy Controls (Very Important)

Users must control what data is visible.

Add Privacy Settings:

User can toggle:

- Share Daily Score (On/Off)
- Share Weekly Average (On/Off)
- Share Monthly Average (On/Off)
- Share Streak (On/Off)
- Share Habit Details (On/Off)
- Share Deep Daily Breakdown (On/Off)

If disabled:

Friend sees “Private”.

7️⃣ Data Required for Comparison

For each user store:

- daily_score
- weekly_average
- monthly_average
- lifetime_average
- task_completion

- good_habits %
- bad_habits %
- hourly_completion %
- first_task_time
- last_task_time
- current_streak
- longest_streak
- level

Must optimize queries for comparison.

8️⃣ Performance Considerations

- Do not calculate in real time repeatedly.
- Cache weekly and monthly aggregates.
- Use indexed queries.
- Limit heavy queries on multi-user comparison.

9️⃣ Gamification Layer

Optional but recommended:

- Show who won today.
- Show weekly winner.
- Show monthly champion.
- Show streak king.
- Show consistency badge.

This increases competitive motivation.

🔟 Future Scalability

Structure for:

- Public leaderboard
- Friend challenges
- 7-day challenge battles
- Custom competition groups
- Team comparison

Do not implement yet, but structure cleanly.

PART 2 — PAID GROUP CREATION SYSTEM

This is the second major feature inside Grow Together.

This is separate from friend comparison.

💬 Group Creation Feature

Users can:

- Create a Group
- Invite Members
- Manage Members
- Chat in group

⚠️ Important Rule:

Only users with ACTIVE PAID MEMBERSHIP can:

- Create group
- Join group

- Send messages

Free users cannot join paid groups.

1️⃣ Group Creation Flow

User clicks:

Create Group

Fill:

- Group Name
- Description
- Group Privacy:
  - Public (Anyone with membership can join)
  - Private (Invite only)
- Group Icon
- Group Rules

Database:

groups:

- id
- name
- description
- created_by
- privacy_type
- created_at

group_members:

- id
- group_id

- user_id
- role (admin/member)
- joined_at

2️⃣ Membership Check (Very Important)

Before:

- Creating group
- Joining group
- Sending message

System must check:

IF user.subscription_status != active

→ deny access

3️⃣ Messaging System

Group must work similar to WhatsApp group.

Include:

- Text messages
- Emojis
- Message timestamps
- Reply to message
- Edit message (optional)
- Delete message
- Seen status (optional)
- Typing indicator (optional)

No calling required initially.

Optional future:

- Voice call
- Video call

  (Structure for scalability but do not implement heavy WebRTC now.)

4️⃣ Group Chat Database

messages:

- id
- group_id
- user_id
- message_text
- created_at
- updated_at

Must support:

- Real-time updates
- WebSocket or polling
- Fast loading
- Pagination for older messages

5️⃣ Group Roles

Admin can:

- Add/remove members
- Delete messages
- Edit group info
- Promote member to admin

- Lock group temporarily

Member can:

- Send messages
- Leave group

6️⃣ Group Discovery

Public Groups:

- Show list
- Show member count
- Show description
- Join button (if membership active)

Private Groups:

- Join via invite link only

7️⃣ Security Requirements

- Only members can read messages
- Secure group isolation
- Validate membership on every action
- Prevent unauthorized access

8️⃣ Performance Requirements

- Optimize chat loading
- Load last 50 messages initially
- Lazy load older messages
- Use indexed queries

9️⃣ Future Scalability

Structure for:

- Group challenges
- Paid premium groups
- Voice notes
- File sharing
- Group leaderboards
- Team competitions
