Daily Task New

Batch -1

Make these 3 small independent changes only.
Do not touch any other part of the app.

CHANGE 1 — PRIORITY DROPDOWN:
Find the priority/category dropdown in the Daily Task section that currently shows options like "Normal", "Important", "Very Important". Replace those options with exactly these in this order:

1. ASAP
2. High
3. Medium
4. Low
   At the bottom of the dropdown add a "+ Custom" option. When clicked, show a small text input where the user can type their own label and save it. The saved custom label must appear in the dropdown list permanently for future use.

CHANGE 2 — SIDEBAR ORDER:
In the left sidebar navigation, move the "Daily Task" section so it appears as the 2nd item in the list. Do not change any other sidebar items or their order. Do not touch any other files.

CHANGE 3 — DAILY TASK PAGE LAYOUT:
On the Daily Task page, make 2 fixes:

- Extend the dark/gray background of the task list container so it fills the full visible screen height when the page loads.

- The Task Analytics section below the task list is currently visible immediately on page load. Make it hidden by default. It should only become visible when the user scrolls down past the task list.
  Do not delete it — just move it below the fold.

Do not change anything else in the app.

Batch - 2

Build the following connected features all in one go. These all belong together inside the Daily Task section. Do not break any existing functionality.

FEATURE 1 — TASK DETAIL SLIDE-IN PANEL:
When a user clicks on any task in the Daily Task list, open a detail panel that slides in from the right side of the screen. On mobile it should take the full screen. The panel must be independently scrollable.

PANEL HEADER:

- Large bold editable task title at the top. User can click it to rename.
- Top-right corner: three-dot menu with options: Duplicate, Delete.

PANEL PROPERTIES SECTION:
Show properties in a clean layout — label on the left, value on the right. Empty fields must show "Click to set" placeholder text.
Include these default properties:

1. Category — multi-select dropdown using the priority labels already built: ASAP, High, Medium, Low, + Custom option.
2. Due Date — date picker. Auto-set to today's date by default.
3. Assigned To — single line text input. Default: Empty.
4. Progress — status dropdown with options: To Do, In Progress, Done. Default: To Do.
5. Duration — dropdown with these exact options in this order:
   15 min, 30 min, 1 hr, 2 hr, 3 hr, 4 hr, 6 hr, 8 hr, 10 hr,

12 hr, 14 hr, 16 hr, Custom.
When Custom is selected show a small text input for manual entry.
Save the selected duration with the task.

6. Schedule — when user clicks this field, open a popover panel with:
   LEFT SIDE — preset time blocks (selectable, highlights when active):
   - Morning Focus — 6:00 AM to 10:00 AM
   - Office Hours — 9:00 AM to 5:00 PM
   - Afternoon — 12:00 PM to 6:00 PM
   - Evening Wind-Down — 6:00 PM to 10:00 PM
   - Night Owl — 9:00 PM to 2:00 AM
   - All Day (24/7) — no time restriction
   - Custom — user defines their own time range
     RIGHT SIDE — when any preset is selected or Custom is chosen, show:
   - Start Time picker
   - End Time picker
   - Preferred Start Time (optional, default None)
     Each preset must have a pencil edit icon to customize its times.
     Active preset shows a checkmark.
     At bottom: a "+ Create Schedule" button to save a new named preset (e.g. "Gym Hours") that persists across all tasks.
     Save user-created schedule presets to a user_schedules table.
     Show summary on property row like: Schedule: Morning Focus (6AM-10AM)
7. Notification — when user clicks this field, open a popover with:
   - "Enable Reminder" toggle switch at top. OFF by default.
   - When toggled ON show:
     - Reminder Time dropdown: At scheduled time, 5 min before, 15 min before, 30 min before, 1 hr before, 1 day before, Custom (Custom shows number input + minutes/hours/days selector)

- Notification Type — multi-select checkboxes:
  Push Notification (default checked), Sound Alert, Email Reminder
- Sound Picker — only visible when Sound Alert is checked:
  Show a dropdown list of these 5 sounds:
  Gentle Chime, Bell, Digital Ping, Soft Harp, Alert Tone.
  Each sound has a small play button so user can preview it.
  Selected sound is highlighted.
- Repeat Reminder toggle — when ON show repeat interval options:
  every 5 min, 10 min, 15 min, 30 min until task is marked complete.
  Show summary on property row like: Notification: 15 min before
  or Notification: Off.
  Save all notification preferences per task to the database.

8. Repeat — when user clicks this field, open a popover card with:
   A) Frequency dropdown with these options:
   No Repeat (default), Every Day, Once a Week, Twice a Week,
   Every 2 Weeks, Once a Month, Every 3 Months, Custom Interval
   (Custom shows number input + days/weeks/months selector)
   B) When Once a Week, Twice a Week, or Every 2 Weeks is selected:
   Show a row of 7 circular day buttons: S M T W T F S
   User taps to select or deselect days.
   Selected days fill with the app accent color with smooth animation.
   Label above the buttons: "Repeat on"
   C) When Once a Month or Every 3 Months is selected:
   Show a dropdown: "On day [1-31]"
   Also show option: "On the first Monday" / "On the last Friday" etc.
   D) End Condition section (collapsible, optional):
   - Repeats forever (default)
   - Until a specific date (date picker)
   - After X occurrences (number input)
     Show summary on property row like: Repeat: Every Day or Repeat: None
     Save recurrence rules to the database on the task record.
9. Flagged — checkbox. Default unchecked.

10. Review Later — checkbox. Default unchecked.

ADD A FIELD BUTTON:
Below all properties show a "+ Add a field" button.
When clicked open a field picker popover with 2 sections:

Section A — Quick Suggestions (top):
Show these 4 suggestions: Priority, Labels, Summary, Effort Score

Section B — All Field Types (scrollable list below):
Include all of these types with an icon and label for each:
Short Text, Long Text, Number, Single Select, Multi Select,
Status Tracker, Date, Date Range, Team Member, Attachment,
Toggle (Checkbox), Link (URL), Email Address, Phone Number,
Rating (1-5 stars), Calculated Field (placeholder),
Linked Record, Auto Timestamp Created, Auto Timestamp Updated,
Created By, Last Modified By, Location, Unique ID, Action Button.

When user selects a field type:

- Show an inline text input asking them to name the field
- Once confirmed, add the new field to the properties section immediately
- Field is immediately editable
- When adding a custom field ask: "Apply to all tasks or this task only?"
  Save all custom fields to the database using a flexible JSON schema
  or custom_fields table with key-value pairs.

PANEL NOTES SECTION:
Below properties show a Notes section with:

- A text input with placeholder: "Write a note or leave a comment..."
- Support basic text input

PANEL BODY AREA:
Below notes show a large open text area with placeholder:
"Start writing..."
This area should expand as the user types.

FEATURE 2 — SCHEDULE TASK IN DAILY TASK:
In the main Daily Task page (outside the detail panel), add a

"Scheduled" view or indicator so users can see which tasks have a schedule set. Tasks with a schedule assigned should show a small schedule icon or time label next to them in the task list.

DESIGN REQUIREMENTS FOR ALL OF THE ABOVE:

- Dark theme throughout. Soft rounded corners on all elements.
- Accent colors: use teal, soft purple, or warm amber.
  Do NOT copy Notion's gray/white style.
- All popovers (Schedule, Notification, Repeat, Field Picker) must use a frosted or slightly lighter background to stand out from the dark panel. Rounded corners 12-16px, soft drop shadow, smooth fade-in animation.
- Panel slides in from the right with smooth animation.
- Each property row shows a hover highlight when user hovers over it.
- Empty fields show "Click to set" — never show blank space.
- Day selector buttons (S M T W T F S) are circular, evenly spaced, smooth color fill animation when tapped or clicked.
- Panel is fully responsive. On mobile it takes the full screen.
- Smooth expand animation when a new custom field is added.

DATABASE — save all of the following:

- All task properties including custom fields (use JSON column or custom_fields table with key-value pairs)
- User schedule presets in a user_schedules table
- Recurrence rules in a recurrence_rules table or JSON field on task
- Notification preferences per task (reminder time, type, sound, repeat interval)

Do not break the existing task list, calendar, or any other part of the app.

PATCH 1 — Calendar Upgrades

Mode: Economy | Toggles: OFF | Complexity: Medium

These are upgrades to your existing Daily Tasks Calendar. They touch the same files so they go together.

Features in this patch:

1A — Monthly Calendar Task Visibility
Show task names as small chips/dots inside each day cell on the month view, exactly like Notion calendar. Currently tasks are invisible in month view.

1B — Task Click Panel from Calendar
When user clicks a task chip on the monthly calendar, open a slide-in side panel showing: task title, importance level, score, timings. Panel should look like the Notion task panel shown in the PDF (dark background, property rows, comments section).

1C — Drag to Reschedule on Calendar
Allow users to drag a task from one day to another in both month view and week view. Dropping on a new day updates the task's due date in the database.

1D — Day View Time Blocks
In the Day view only, show tasks as time blocks on a vertical hourly timeline, similar to Todoist's day view shown in the PDF. Tasks with scheduled times appear as coloured blocks at the correct hour.

1E — Smart Last-Used View Memory
Remember which view (Task / Calendar / Board) the user last used. When they click Daily Tasks from the sidebar, automatically open that view. The other two views appear as tabs beside it.

PATCH 2 — Task Detail Panel Redesign

Mode: Economy | Toggles: OFF | Complexity: Medium

This replaces the current basic description popup with a proper side panel.

Features in this patch:

2A — Replace Description Popup
Remove the current small popup box that appears when clicking task description. Replace it with nothing — the description will now only appear inside the new Task Detail Panel below.

2B — Task Detail Side Panel
When user clicks any task row, open a slide-in panel from the right side. The panel must show: task title as heading, importance level row, score row, date row, timings row, notes/description body area below. Design must match the Notion-style panel shown in the PDF exactly (dark background, property labels on left, values on right, Comments section below properties, numbered color guide at bottom: 1HR Less = Red, 1–4HRS = Blue, 4HRS+ = Green).

PATCH 3 — Task Bank Upgrades

Mode: Economy | Toggles: OFF | Complexity: Medium

These are changes to the existing Task Bank section only.

Features in this patch:

3A — Replace ADD Button Flow
Currently: user types in input field then clicks Add. Change this: Remove the text input from the top bar. Replace "ADD" button with a "+" button. When user clicks "+", a new blank task row appears inline for them to type directly into. Do not change any other part of the Task Bank page.

3B — Task Bank Click Panel
When user clicks an existing task in Task Bank, open a side panel showing editable fields: Importance Level (dropdown: Low / Medium / High / Critical), Date picker, Time picker, Description text area. Panel design must match the Notion-style panel shown in the PDF.

PATCH 4 — Board View (Kanban)

Mode: Economy | Toggles: OFF | Complexity: HIGH — Build in 4 sub-layers

This is the biggest feature. Must be built in layers. Do NOT build all at once.

Layer 4A — Board Structure (Lite Mode)
Add "Board" as a third tab next to "Task" and "Calendar" at the top of the Daily Tasks page. When clicked, show empty columns layout with "Future" and "+ New Group" button. No logic yet, no database, just the visual skeleton.

Layer 4B — Column and Card Interaction (Economy Mode)
Add "+ New Task" button inside each column. Clicking it adds a task card. Cards show task title only. Columns can be renamed. "+ New Group" creates a new empty column.

Layer 4C — Drag and Drop (Economy Mode)
Implement drag and drop using dnd-kit library. Tasks can be dragged between columns. Tasks can be reordered within a column. Columns can be reordered left and right.

Layer 4D — Full Card + Settings + Filters (Economy Mode)
Add all features from the PDF: task card shows title, importance tag, execution score. Clicking card opens side panel with all editable properties (title, description, due date, priority, tags, status, progress, subtasks, reminder, estimated time). Add Board Settings panel (⚙️ icon) with toggles: show data source titles, show page icon, wrap all content, color columns. Group by options: status, tags, priority, due date. Card preview: none/page content/attachments. Card size: small/medium/large. Card layout: compact/list. Add filter bar at top: filter by tags, priority, status, due date, completion. Sort by: due date, priority, created date, alphabetical, progress. Add search bar. Add column management menu (rename, delete, duplicate, collapse). Add automations: when moved to Completed → set progress 100%, when due date passes → mark overdue, when created → add timestamp. All board tasks share same database as Task view and Calendar view.

PATCH 5 — Task Execution Scoring System

Mode: Economy | Toggles: OFF | Complexity: Medium

This adds the scoring system across all task views.

Features in this patch:

5A — Execution Score Field in Database
Add these new columns to the tasks database table: execution_score (integer 0–10), importance_level (text), planned_time_minutes (integer), actual_time_minutes (integer), execution_percentage (integer). Do not change any other database columns.

5B — Execution Score in Task Detail Panel
Inside the Task Detail Panel (built in Patch 2), add a new section called "Execution Score". Display 11 clickable number buttons: 0 1 2 3 4 5 6 7 8 9 10. When user clicks a number, save that score. System auto-converts to percentage (score × 10). Color system: 0–3 = red, 4–6 = yellow, 7–8 = light green, 9–10 = dark green.

5C — Daily Execution Average on Dashboard
On the Daily Tasks page header area, add a new stat display: "Today's Execution Score: X.XX / 10 (XX%)". Formula: sum of all task scores for that day divided by number of tasks scored.

5D — Score Visible on Board Cards
On Board View task cards, show execution score indicator and importance level tag beneath the task title. Example: "Execution: 8/10 | Importance: High".

PATCH 6 — Voice Features

Mode: Economy | Toggles: OFF | Complexity: HIGH — Build in 3 sub-layers

This is the most complex feature. Must be built carefully in layers.

Layer 6A — Basic Mic Button + Speech to Text (Economy Mode)
Add a microphone icon (🎤) in two locations only: next to the Add Task button in Task Bank, and inside the Quick Add Task input field in Daily Tasks. When clicked, request microphone permission, start recording, show "Listening..." indicator with a pulsing animation, display live transcription of speech as text in real time using Web Speech API. Show Stop button to end recording. No AI parsing yet.

Layer 6B — AI Task Parser (Economy Mode)
After recording stops, take the transcribed text and parse it automatically to

extract: task title, due date, due time, priority level, labels/tags, estimated duration. If multiple tasks are mentioned in one voice session, create multiple separate parsed tasks. Show a Task Review Panel with all parsed tasks in an editable list. User can edit any field. Two buttons at bottom: "Add Tasks" and "Cancel". When Add Tasks clicked, save all tasks to database. Tasks appear in Task view, Calendar view, and Board view automatically.

Layer 6C — Mic in Description and Notes Fields (Economy Mode)
Add a small microphone icon inside every Description text field and every Notes text field throughout the entire app. When clicked, start recording. Speech is transcribed in real time and appended into that specific text field. Does not create tasks — only writes spoken words as text into the field.
