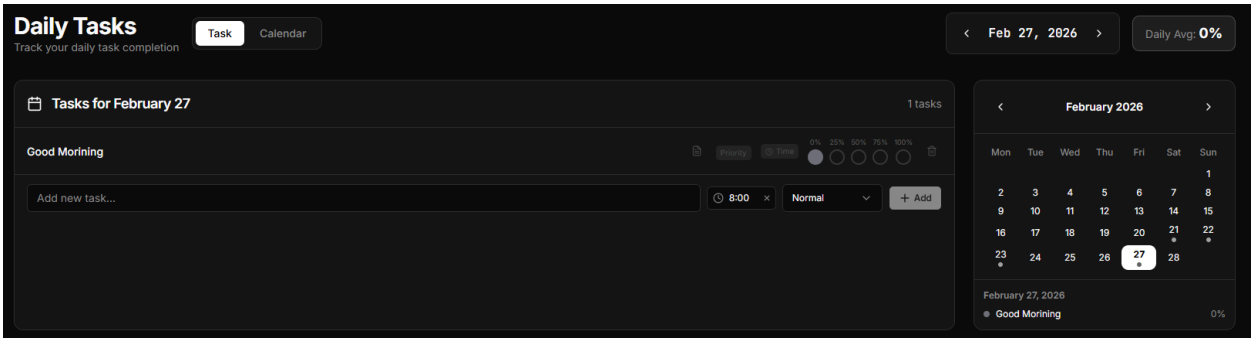
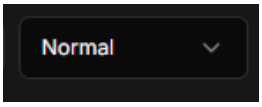
Daily Task

Catoerogery





In the above u can have a look

Instead of that normal important very important place this

1. ASAP
2. High
3. Medium
4. Low

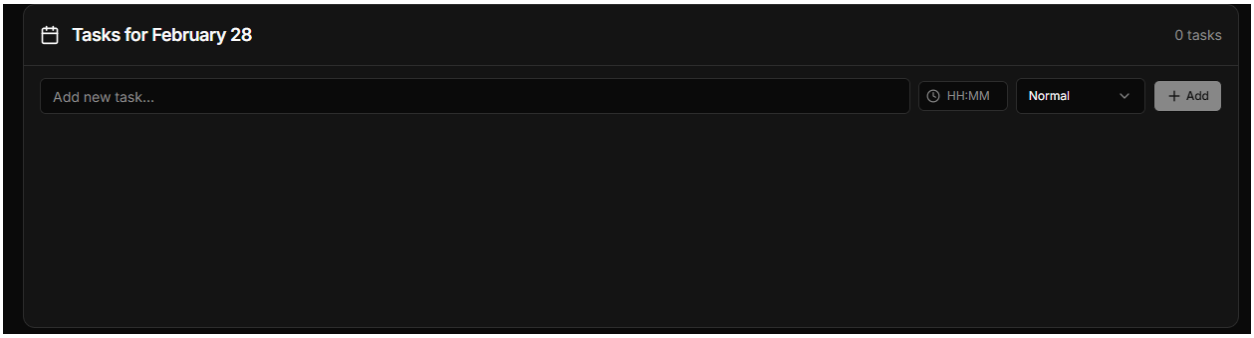
- And they need to have option of customisation too they can write what they like and they can place it overtheir

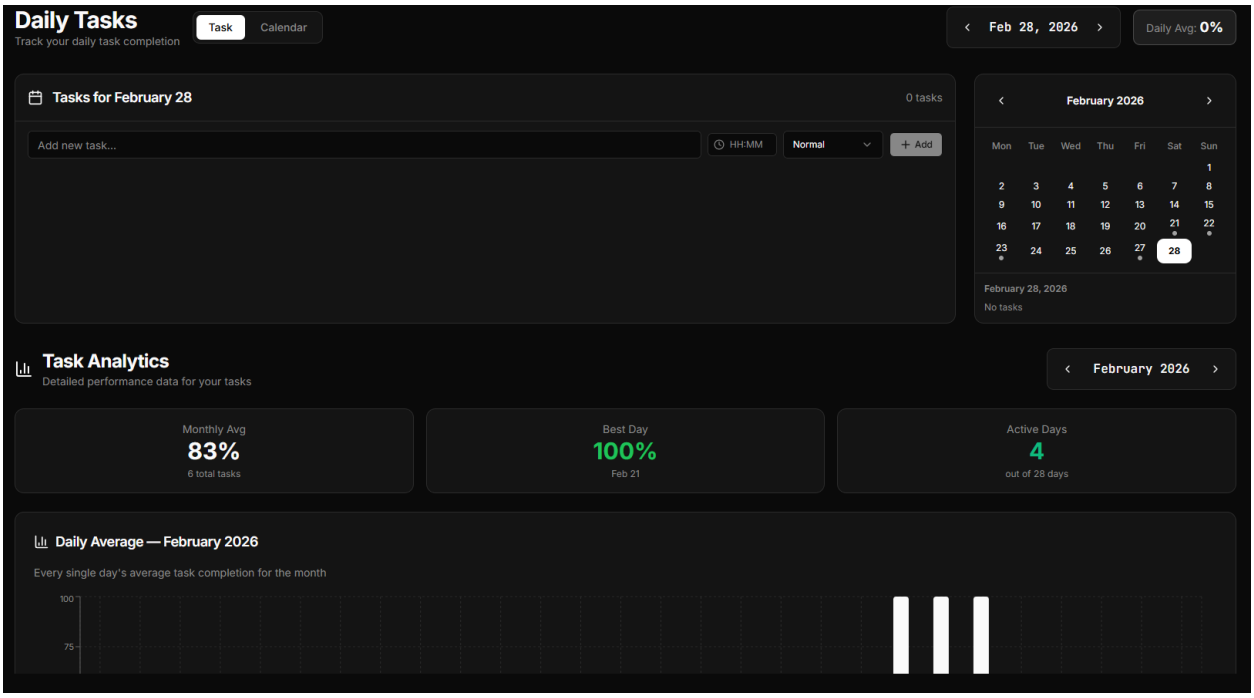
Side Bar [All the Sections]

- 2nd section need to be the Task section becuase this is where most of the people use it

Daily Task

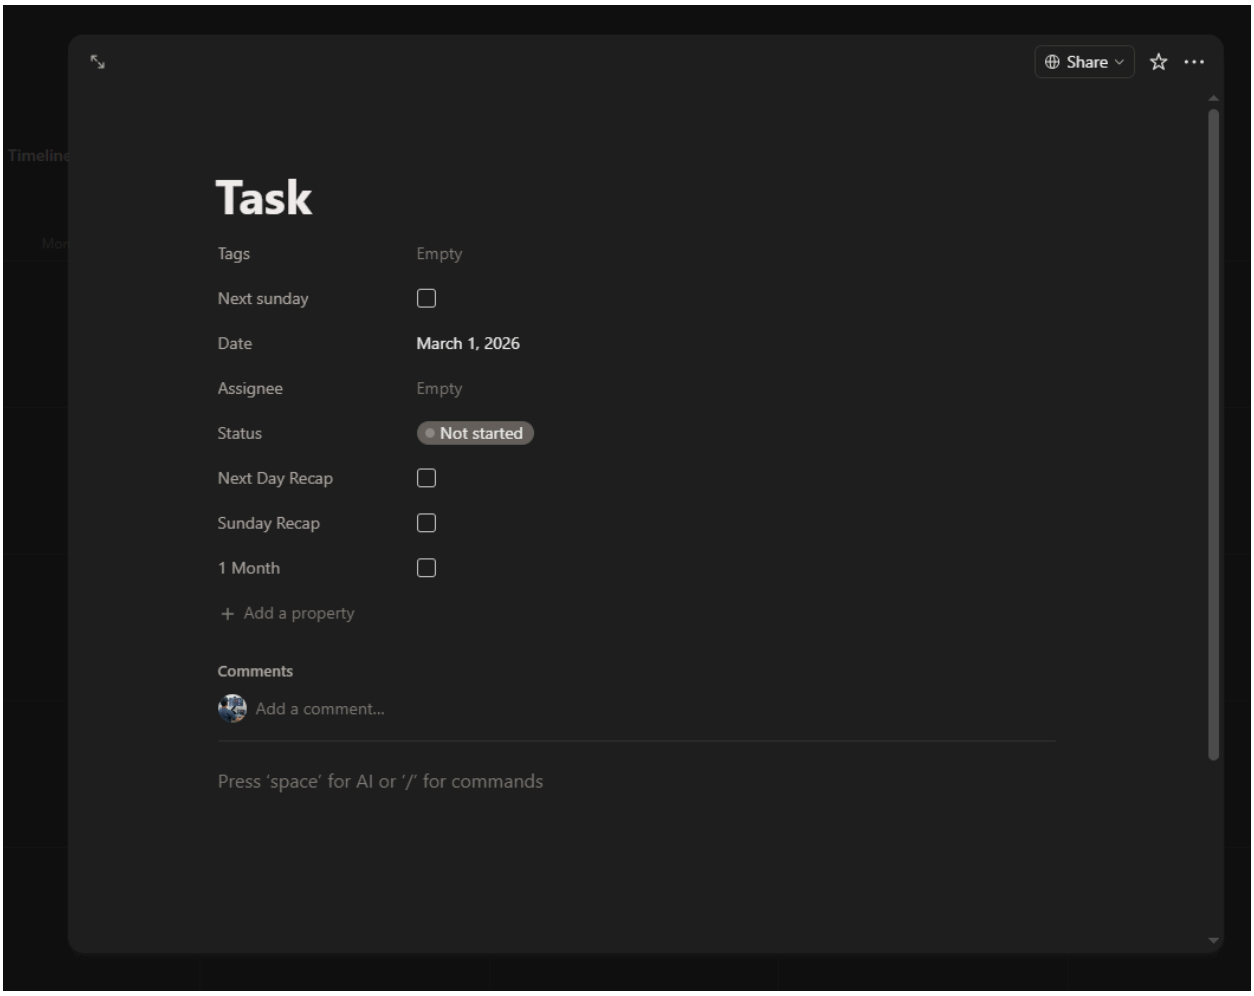
- The below Task section Need to extent the gray part till down becuase when person clicks the Daily Task in home section the below task anylaisis looking very distractive . The daily task need to be there but it need to appear when we scroll down .





Duraction in Daily task

- Try to Add duraction of the work in the daiy task like from 15 Minutes to 16hrs [15,30,1hr,2hr,3hr,4hr,6hr,8hr,10hr,12hr,14hr,16hr.
- People can choose this and for every task they do they will write down this
- And people can also manually write down how much time they need create this option too
- it need to appear like this when he or she clikc the task and insted of option in the photos the option which i have shared before and duraction need to be there add there



Recurring in Daily Task

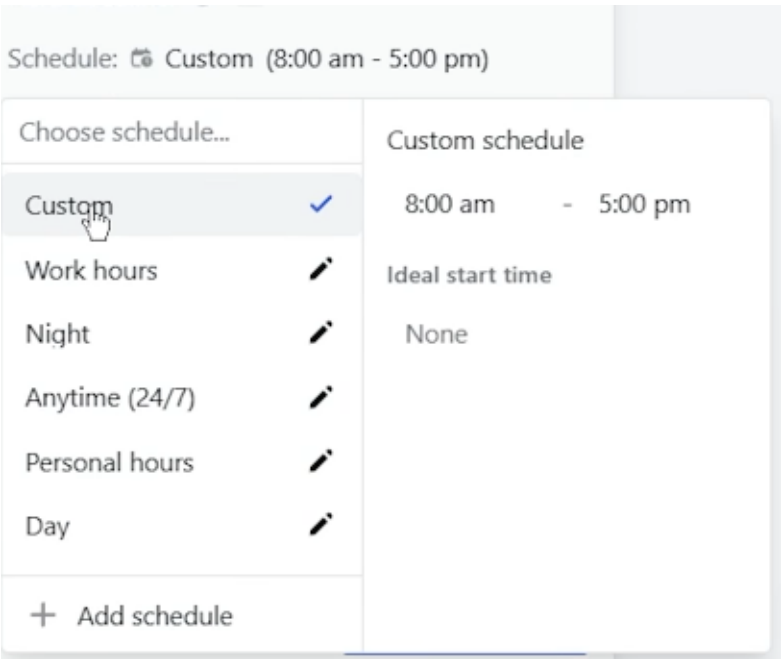
Schdeule task in daily Task



Replit Prompt — Task Detail Panel with Custom Properties

Feature: Task Detail Slide-Out Panel + Dynamic Property System

Build a **Task Detail Panel** that opens when a user clicks on any task from their daily task list. This panel should slide in (or open as a modal/overlay) and allow the user to view, edit, and customize every aspect of a task. The design should feel modern, clean, and dark-themed — but with its own unique identity (not a clone of any existing app).

---

1. Task Detail Panel (opens on task click)

When a user clicks on a task from their daily task list, a **detail panel** should appear (slide-in from the right, or full-page overlay — choose whichever fits the app

layout best). This panel contains:

Header Section:

- Editable task title at the top (large, bold text — user can click and type to rename)
- A share/options menu in the top-right corner (three-dot menu with options like Duplicate, Delete, Copy link)

Properties Section (below the title):
Display default task properties in a clean **label : value** layout (left-aligned labels, right-aligned values). Default properties include:

Property	Type	Default Value
Category	Multi-select	Empty
Due Date	Date picker	Auto-set to task creation date
Assigned To	Person	Empty
Progress	Status	"To Do"
Schedule	Custom UI	See Section 2 below
Notification	Custom UI	See Section 3 below
Repeat (Recurring)	Custom UI	See Section 4 below
Flagged	Checkbox	Unchecked
Review Later	Checkbox	Unchecked

Note: These are the defaults — the user can remove any of them or add new ones (see Section 5 below).

"+ Add a field" Button:
Below all properties, show a **"+ Add a field"** button. Clicking it opens the **Field Picker** (see Section 5).

Comments / Notes Section:
Below properties, include:

- A "Notes" or "Discussion" section header
- An input box with placeholder text: "Write a note or leave a comment..."
- Support basic text input (rich text is a bonus but not required)

Body / Description Area:
Below comments, provide a large open content area where the user can type freely — like a mini document editor. Placeholder: "Start writing, or press '/' for commands..." (the slash commands are optional/future — just show the placeholder for now).

---

2. Schedule Feature (Built-in Task Property)

Each task should have a **Schedule** property that lets users define when they plan to work on the task. When the user clicks the Schedule field, a **popover/dropdown panel** appears with:

A) Preset Time Blocks (left side or top of popover):
Show a selectable list of schedule presets. Each one is clickable and highlights when selected. Include presets like:

- ☀️ **Morning Focus** — 6:00 AM – 10:00 AM
- 💼 **Office Hours** — 9:00 AM – 5:00 PM
- 🌅 **Afternoon** — 12:00 PM – 6:00 PM
- 🌙 **Evening Wind-Down** — 6:00 PM – 10:00 PM
- 🦉 **Night Owl** — 9:00 PM – 2:00 AM
- 🔄 **All Day (24/7)** — No time restriction
- ⚙️ **Custom** — User defines their own time range

B) Custom Schedule Panel (right side or below, shown when "Custom" is selected or any preset is selected for editing):

- **Start Time** — time picker (scrollable hours/minutes, or dropdown)
- **End Time** — time picker
- **Preferred Start Time** — optional field; the ideal time within the window to begin ("None" by default)

C) "+ Create Schedule" Button:
At the bottom of the presets list, let users **create and save their own named schedule presets** (e.g., "Gym Hours", "Study Block"). These saved presets persist and appear in the list for future tasks.

Design notes:

- The popover should feel clean with a light or semi-transparent background inside the dark-themed app (create visual contrast so the schedule picker stands out).
- Each preset should have an edit icon (pencil) next to it so users can customize the times of any preset.
- The currently active schedule should show a checkmark or highlight.
- Display the active schedule as a summary on the task property row, e.g., `Schedule: ☀ Morning Focus (6:00 AM – 10:00 AM)`

---

3. Notification / Reminder Feature (Built-in Task Property)

Each task should have a **Notification** property that lets users set reminders. When the user clicks the Notification field, a **popover/dropdown** appears with:

A) Toggle Switch:
At the top: **"Enable Reminder"** — a toggle switch (ON/OFF). Off by default.

B) When toggled ON, show these options:

- **Reminder Time** — dropdown or picker for when to send the reminder relative to the task's due date or schedule:
  - At the scheduled time
  - 5 minutes before
  - 15 minutes before
  - 30 minutes before
  - 1 hour before
  - 1 day before
  - Custom (user types a number + selects minutes/hours/days)
- **Notification Type** — how the user wants to be notified:
  - 🔔 Push Notification (default)
  - 🔊 Sound Alert

    - 📧 Email Reminder
    - User can select multiple
- **Sound Picker** (shown if "Sound Alert" is selected):
    - A mini dropdown with 5–8 notification sounds to choose from (e.g., "Gentle Chime", "Bell", "Digital Ping", "Soft Harp", "Alert Tone")
    - Each sound has a small ▶️ play button next to it so the user can preview
    - Selected sound is highlighted
- **Repeat Reminder** — optional toggle:
    - If ON: remind again every X minutes until the task is marked complete (e.g., every 5 min, 10 min, 15 min, 30 min)

Design notes:

- Keep it compact — the popover shouldn't feel overwhelming. Use collapsible sections if needed (e.g., "Advanced options" for sound picker and repeat).
- Show a summary on the task property row, e.g., `Notification: 🔔 15 min before` or `Notification: Off`

---

4. Recurring / Repeat Feature (Built-in Task Property)

Each task should have a **Repeat** property that lets users set recurrence. When the user clicks the Repeat field, a **popover/dropdown card** appears with:

A) Repeat Frequency Dropdown:
A dropdown selector with these options:

- **No Repeat** (default)
- **Every Day**
- **Once a Week**
- **Twice a Week**
- **Every 2 Weeks**
- **Once a Month**
- **Every 3 Months**

- **Custom Interval** — user types a number + selects (days / weeks / months)

B) Day Selector (shown when frequency involves weeks):
When the user picks "Once a Week", "Twice a Week", or "Every 2 Weeks":

- Show a **row of 7 day buttons**: `S M T W T F S`
- User taps to select/deselect specific days
- Selected days are highlighted with the app's accent color (e.g., filled circle or colored background)
- Label above: "On these days" or "Repeat on"

C) Day-of-Month Selector (shown for monthly recurrence):
When "Once a Month" or "Every 3 Months" is selected:

- Show a dropdown: "On day [number]" — e.g., "On day 1", "On day 15"
- Or option: "On the first Monday", "On the last Friday", etc.

D) End Condition (optional, collapsible):

- **Repeats forever** (default)
- **Until a specific date** — date picker
- **For X occurrences** — number input (e.g., "Repeat 10 times then stop")

Design notes:

- The repeat card/popover should have a clean, card-like appearance with rounded corners and soft shadows.
- Use a light or slightly contrasted background for the popover interior to make it visually distinct within the dark app theme.
- The day selector buttons (S M T W T F S) should be circular, evenly spaced, and satisfying to tap — with a smooth color fill animation when selected.
- Show a summary on the task property row, e.g., `Repeat: 📅 Every weekday (Mon–Fri)` or `Repeat: None`

---

5. Field Picker (Add a Field)

When the user clicks **"+ Add a field"**, open a **dropdown or popover menu** with two sections:

Section A — Quick Suggestions (top of dropdown):
Show 3–4 commonly used fields the user hasn't added yet. These rotate based on what's missing from the current task. Examples:

- 🔥 Priority (Select)
- 🏷️ Labels (Multi-select)
- 📝 Summary (Text)
- 🔢 Effort Score (Number)

Section B — All Field Types (scrollable list below suggestions):
Group these under a "Field Type" subheading. Each item shows an icon + label. The user picks a type, then names the field.

Here is the list of field types to include:

- **Short Text** — single-line text input
- **Long Text** — multi-line / paragraph input
- **Number** — numeric input
- **Single Select** — dropdown with one choice
- **Multi Select** — dropdown with multiple choices (tags)
- **Status Tracker** — customizable status pipeline (e.g., To Do → In Progress → Done)
- **Date** — date picker
- **Date Range** — start and end date
- **Team Member** — assign a person
- **Attachment** — upload files or images
- **Toggle (Checkbox)** — true/false switch
- **Link (URL)** — clickable URL field
- **Email Address** — email input

- **Phone Number** — phone input
- **Rating** — star or numeric rating (1–5)
- **Calculated Field** — formula-based (can be placeholder for now)
- **Linked Record** — reference another task or item
- **Aggregation (Rollup)** — summarize data from linked records (placeholder OK)
- **Auto Timestamp (Created)** — auto-filled creation time
- **Auto Timestamp (Updated)** — auto-filled last edit time
- **Created By** — auto-filled creator name
- **Last Modified By** — auto-filled last editor
- **Location / Place** — address or map pin
- **Unique ID** — auto-generated identifier
- **Action Button** — trigger an action (placeholder OK)

Behavior when user selects a field type:

1. User clicks a field type from the list
2. An inline input appears asking them to **name the field** (e.g., "Deadline", "Client Name")
3. Once they confirm, the new field is added to the task's property section
4. The field is immediately editable

---

6. UX & Design Guidelines

- **Theme:** Dark mode by default. Use soft rounded corners, subtle borders, and muted accent colors (e.g., teal, soft purple, warm amber — NOT Notion's exact gray/white palette).
- **Popovers for Schedule, Notification, Recurring:** These should feel like elevated cards — use a slightly lighter or frosted background to contrast against the dark panel. Rounded corners (12–16px), soft shadow, smooth open/close animations.

- **Layout:** The property section should feel like a structured form but not rigid — think relaxed spacing, hover highlights on each row, smooth transitions.
- **Scroll:** The detail panel should be independently scrollable. The body/description area should take up remaining space and expand as the user types.
- **Responsiveness:** Should work on both desktop and mobile. On mobile, the panel should take the full screen.
- **Animations:** Subtle slide-in for the panel, fade-in for popovers and dropdowns, smooth expand when a new field is added, color fill transition on day selector buttons.
- **Empty States:** When a property value is empty, show a muted placeholder like "Empty" or "Click to set" — not just blank space.

---

7. Data Persistence

- All task properties (including custom fields added by the user) should be saved to the database.
- Custom fields should be stored in a flexible schema (e.g., a JSON column or a separate `custom_fields` table with key-value pairs).
- **Schedule presets** created by the user should be saved to a `user_schedules` table so they persist across tasks.
- **Recurring tasks:** When a task is set to repeat, the system should automatically generate the next occurrence when the current one is completed or when the due date passes. Store recurrence rules (frequency, days, end condition) in a `recurrence_rules` table or JSON field on the task.
- **Notification preferences** per task should be stored (reminder time, notification type, sound choice, repeat-reminder settings). The backend should have a job/scheduler that triggers notifications at the right time based on these settings.
- When a user adds a custom field to one task, offer the option to **apply it to all tasks** or keep it task-specific.
