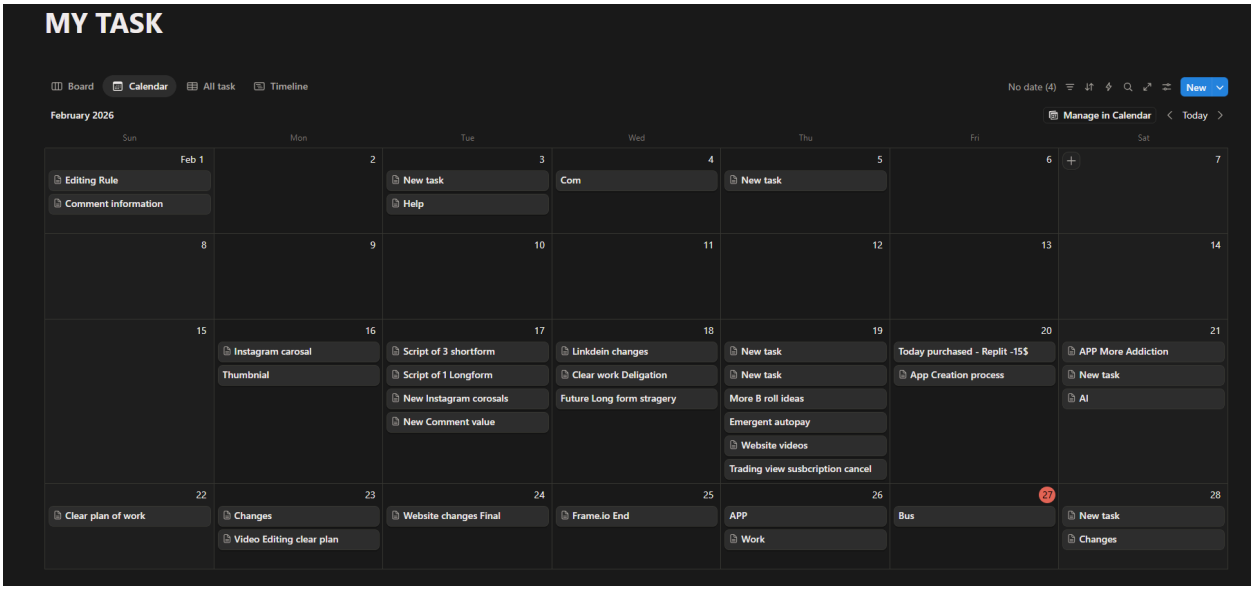
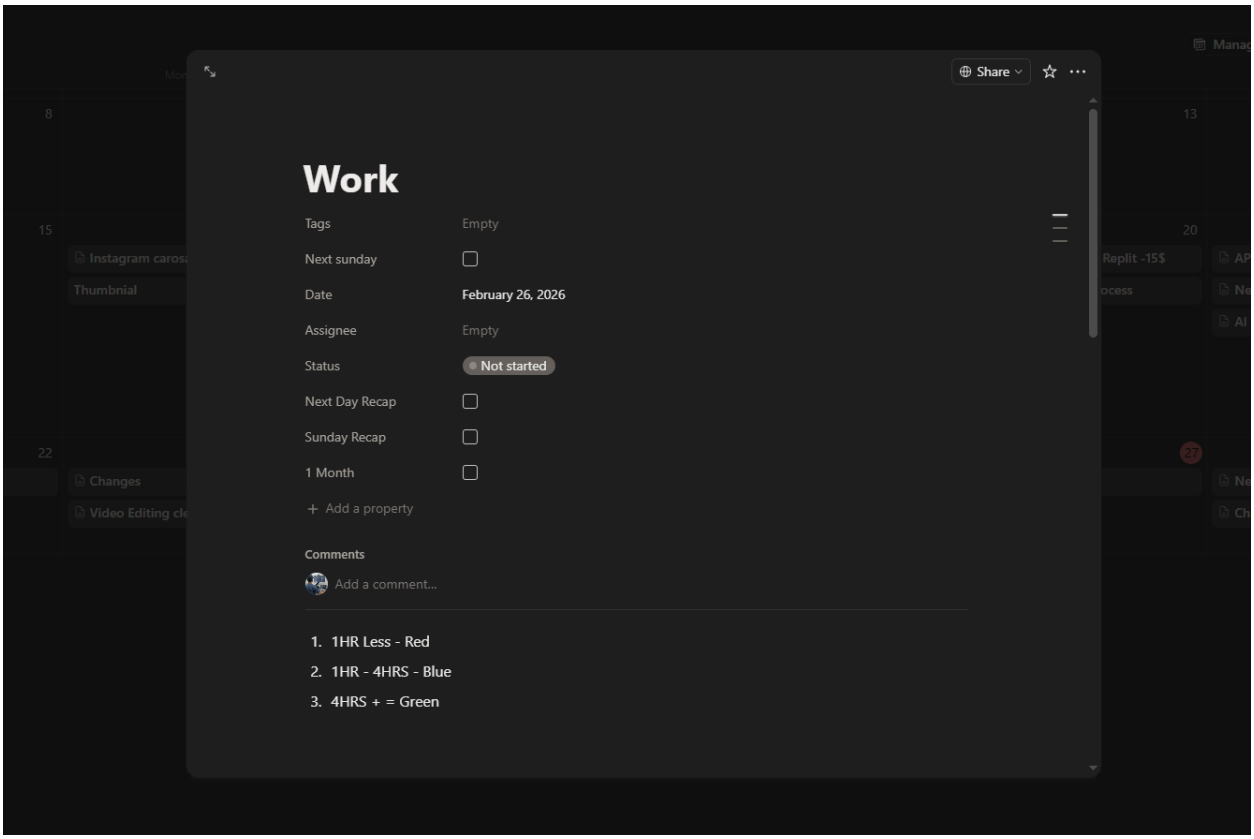
More changes in the app Changes



- The above is notion calender where in month we can see clearily the task in notion claender but in my app i can even see .
- I need feature of

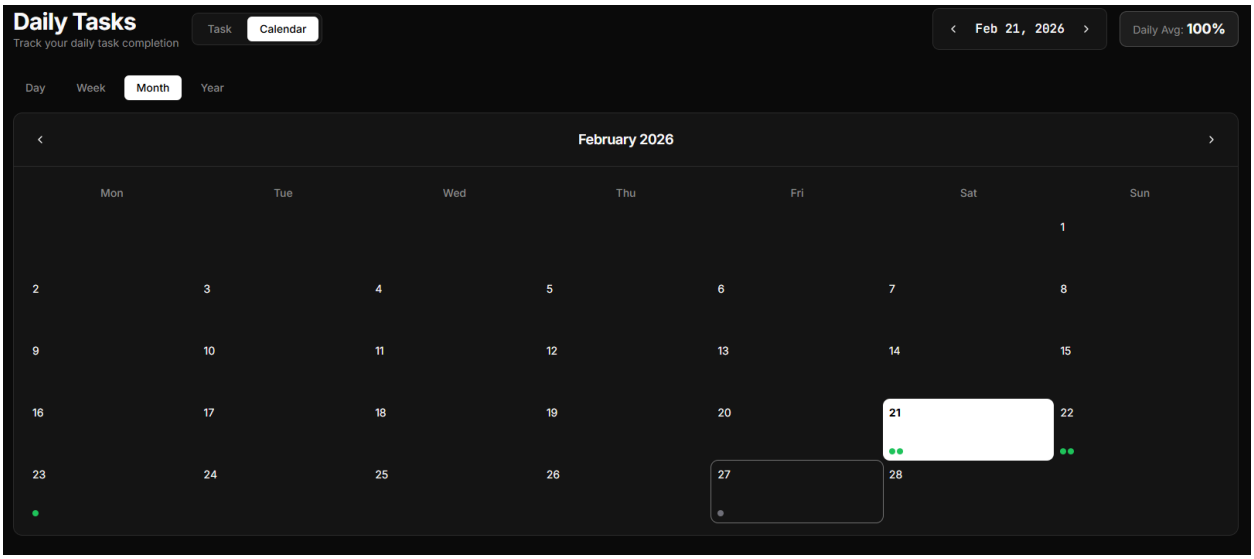
1. I Can see the particular task on that day
2. If i click the task which is visbile on the montly then the task like this need to appear

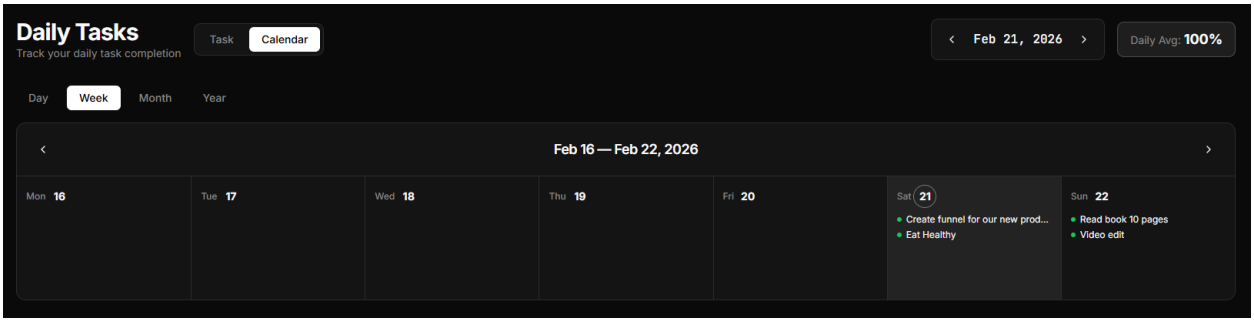
As u can see below as in our task there will be options like important level , Score , Timings . It need to appear in the place of which is visbile in below image in the place of TASKS NEXT SUNDAY DATE STAUTS NEXT DAY RECAP SUNDAY RECAL 1MONTH COMMENTS . And as u can see below below we can write down information some thing which we want



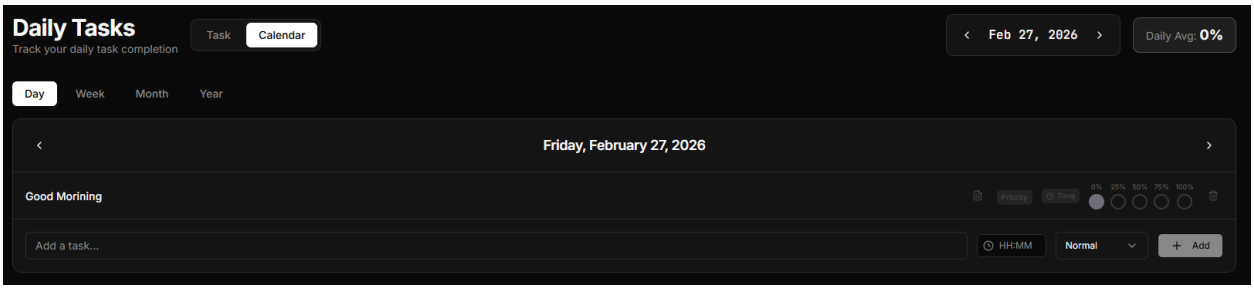
3. We can move the task clearily from 1 date to other in the montl calender and week calender

Below as u can see this is how our claender looks now i hope u understand the chnages which am looking for





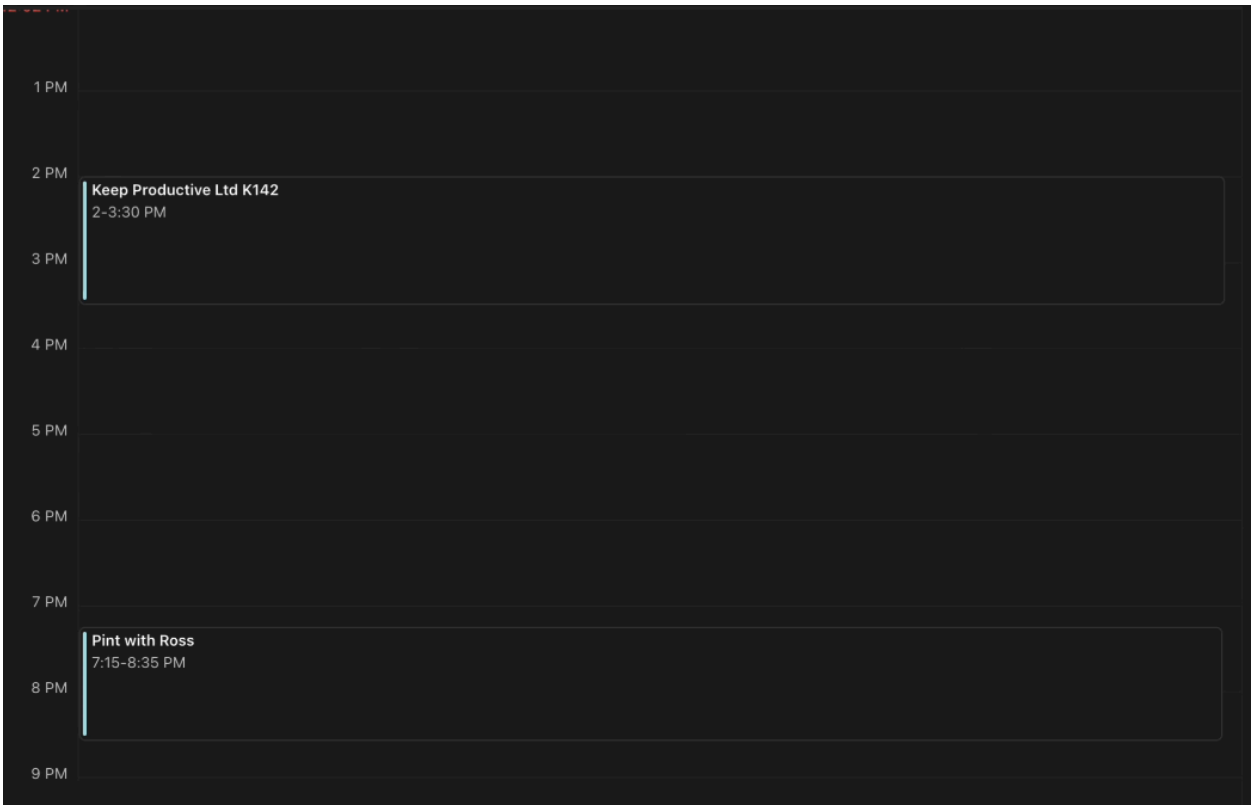
Daily Task chnages in the calender



As u can have a look in the claender of daily task of that day .

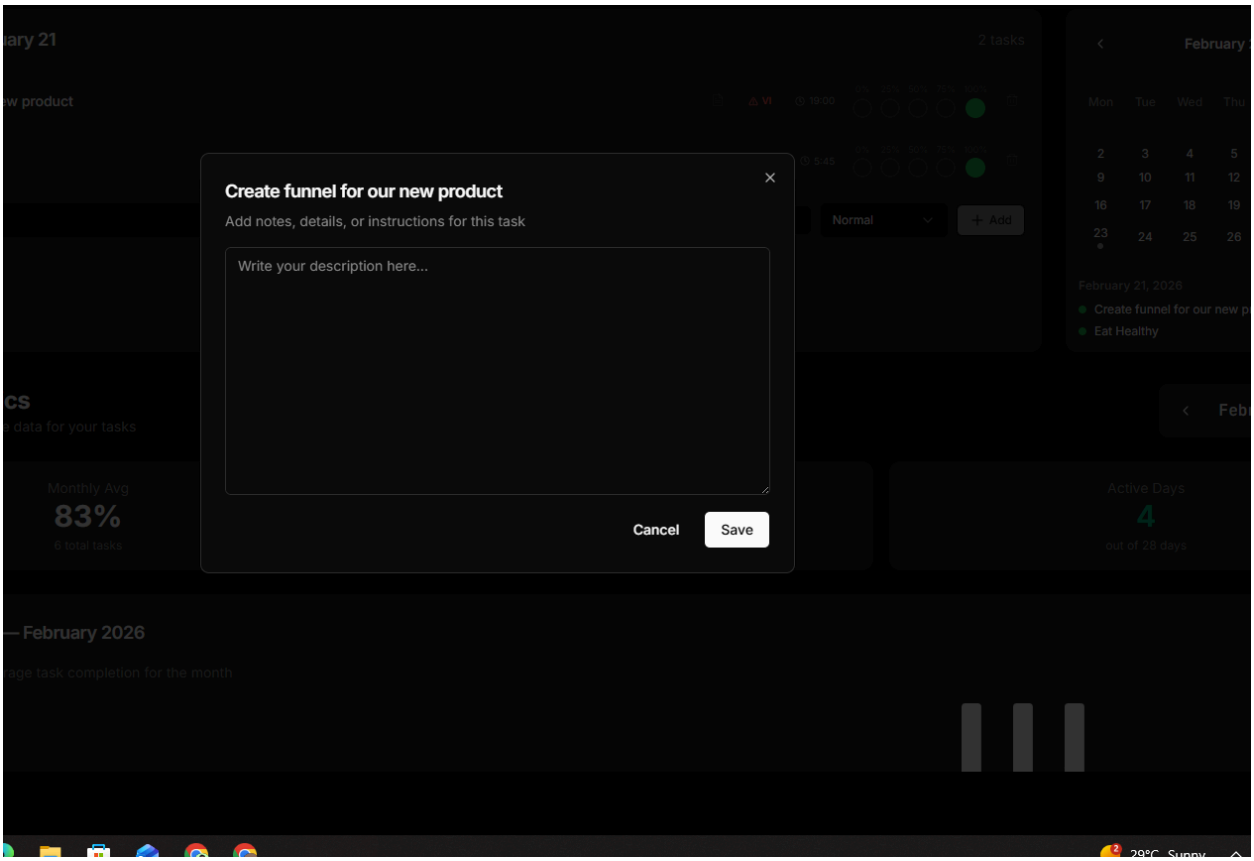
Before it is like that how we write the task it appear in the day

But only in the day in calende it need to appear like below which is off todoist , this app todoist created the same so we will do the sam as most people do it the same

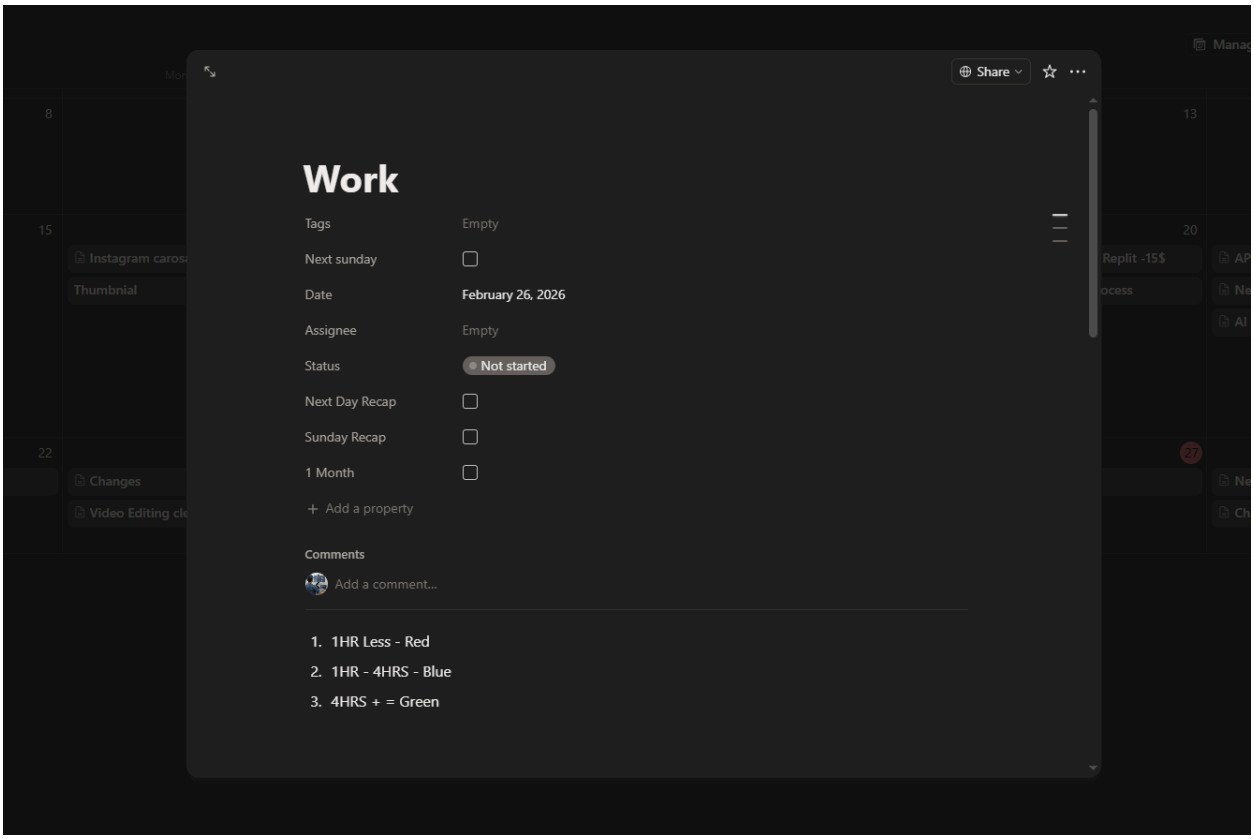


The way it appear when we click the description

- Before when we clikc the descripton of the task this type of page appear as u can see clearily



But as of now the above way of how the description looks it should appear at all



It need to apear like this above one . as above i told clearily how does it need to look like

The above look which is there it is heading of the task and remaining as u know the infromation

Another feature [Board]

You are building a **production-level Board (Kanban) system** inside my application called **Consistency System**.

The board must function similar to the **Board View in Notion**, with modern UI and powerful task management capabilities.

This board must integrate with the existing **Daily Task system**.

---

1. LOCATION OF THE FEATURE

Inside the **Daily Task section**, add three view options at the top of the page:

1. Task
2. Calendar
3. Board

These should behave as **view switchers**.

When the user clicks **Board**, the system must display a **Kanban board layout**.

All three views must use the **same task database**, meaning:

Tasks created in Board View must automatically appear in Task View and Calendar View.

---

2. BOARD LAYOUT (KANBAN STRUCTURE)

The board should contain:

Columns (also called Groups).

Each column contains multiple **task cards**.

Example layout:

Column: Future

- Charlie Morgan Year Sheet
- Brand Presence
- Blockchain
- Meet – Time Saving
- Future Life Plan
- Competitor Advantage
- Hiring Employees

Each column must include:

- Column title
- Task cards list

- "+ New Task" button
- Column settings menu
- Drag handle

Columns must be horizontally scrollable.

Users should also be able to **reorder columns by dragging them**.

---

3. TASK CARD DESIGN

Each task card must support the following properties:

Core properties:

- Task Title
- Description
- Due Date
- Priority
- Tags
- Status
- Progress percentage
- Attachments
- Notes

Optional properties:

- Subtasks
- Reminder
- Estimated time
- Completed checkbox

When a card is clicked, open a **Side Peek Panel** similar to Notion.

Inside the panel users can edit all properties.

---

4. DRAG AND DROP SYSTEM

Implement a robust drag-and-drop system.

Users must be able to:

- Move tasks between columns
- Reorder tasks within a column
- Drag columns left and right
- Drag tasks to archive or delete zone

Use a smooth animation system.

Recommended libraries:

- dnd-kit

or

- react-beautiful-dnd

---

5. BOARD SETTINGS PANEL

Add a **Settings icon (⚙️)** in the top-right corner of the board.

Clicking it opens a **Board Settings Panel**.

The settings should include:

DISPLAY OPTIONS

Toggle switches:

- Show data source titles
- Show page icon
- Wrap all content
- Color columns

GROUPING OPTIONS

Users can group columns by:

- Status
- Tags

- Priority
- Due date
- Custom property

CARD DISPLAY OPTIONS

Card Preview:

- None
- Page content
- Attachments

Card Size:

- Small
- Medium
- Large

Card Layout:

- Compact
- List

---

6. FILTERING AND SORTING

Add controls at the top of the board.

FILTER OPTIONS:

- Tags
- Priority
- Status
- Due date
- Completion status

SORT OPTIONS:

- Due date

- Priority
- Created date
- Alphabetical order
- Progress %

---

7. SEARCH

Add a search bar to quickly find tasks.

The search should scan:

- Task title
- Tags
- Description

---

8. COLUMN MANAGEMENT

Each column should support:

- Rename column
- Delete column
- Duplicate column
- Collapse column
- Add new task

At the far right of the board add:

"+ New Group"

This creates a new column.

---

9. TASK AUTOMATIONS

Add simple automation logic.

Examples:

- When task moved to "Completed" → mark progress = 100%

- When due date passes → mark task as overdue
- When task created → add creation timestamp

---

10. DATABASE STRUCTURE

Design the task database with the following schema:

Task

id

title

description

status

priority

tags

due_date

progress

created_at

updated_at

attachments

subtasks

Column

id

title

order

board_id

---

11. PERFORMANCE OPTIMIZATION

Implement:

- Lazy loading for tasks

- Virtual scrolling if board becomes large
- Optimized state updates

The board must handle **1000+ tasks without lag**.

---

12. USER EXPERIENCE

Design should be similar to modern productivity tools.

UI principles:

- Clean minimal interface
- Smooth drag animations
- Rounded task cards
- Dark mode compatible
- Hover states on cards

---

13. RESPONSIVE DESIGN

Board should adapt to:

Desktop → Full board view

Tablet → Scrollable board

Mobile → Vertical board columns

---

14. TECHNOLOGY

Use the same framework used in the current app.

If React is used:

Use component architecture:

BoardView

Column

TaskCard

TaskPanel

BoardSettings

FINAL GOAL

Create a **fully functional Notion-style Kanban board system** inside the **Consistency System app**.

The board must allow users to visually manage tasks using drag-and-drop columns, advanced filtering, customizable card layouts, and synchronized task data across all views.

This board should feel like a **professional productivity tool**, similar to Notion or modern work management software.

Another change

Add a **Task Execution Scoring System** to the Consistency System application.

This feature must work across all task views including:

- Task view
- Calendar view
- Board view

The goal of this feature is to measure **how well a task was executed**, not just whether it was completed.

---

1. TASK EXECUTION SCORE (Completion Rate)

Each task must have an **Execution Score**.

The score range is:

0 → Task not started

1 → Very poor execution

2

3

4

5 → Half completed

6

7

8

9

10 → Perfect execution (100%)

Instead of simply marking tasks as **completed or not completed**, users must be able to assign a **score from 0 to 10**.

This score represents the **quality of task completion**.

---

2. WHERE THE SCORE APPEARS

When a user clicks on a task card or task item, open the **Task Detail Panel**.

Inside the panel add a new section called:

Execution Score

Display it as either:

- Slider (0–10)

or

- Selectable number buttons

Example UI:

Execution Score

0 1 2 3 4 5 6 7 8 9 10

When the user selects a number, the task is assigned that score.

The system should automatically convert the score to percentage.

Example:

10 → 100%

8 → 80%

6 → 60%

---

3. DAILY EXECUTION AVERAGE

The system must calculate a **Daily Execution Average**.

This is the average score of all tasks completed that day.

Formula:

Daily Average =

Sum of all task scores for the day / Number of tasks

Example:

Task 1 → 8

Task 2 → 6

Task 3 → 10

Task 4 → 7

Average = 7.75

Display this on the **Daily Task page dashboard**.

Example display:

Today's Execution Score

7.75 / 10

(77.5%)

---

4. VISUALIZATION

Add a visual indicator for execution score.

Examples:

- Progress circle

- Progress bar
- Color indicator

Score colors:

0–3 → Red

4–6 → Yellow

7–8 → Light green

9–10 → Dark green

---

5. TASK PROPERTIES

When a user clicks on a task, the task detail panel must allow editing the following properties:

Execution Score (0–10)

Importance Level

Levels:

Low

Medium

High

Critical

Task Time Tracking

Allow users to enter:

- Planned time
- Actual time

Example:

Planned Time → 60 minutes

Actual Time → 75 minutes

---

6. TASK DATA STRUCTURE

Add new fields to the task database.

execution_score (0–10)

importance_level

planned_time_minutes

actual_time_minutes

execution_percentage

---

7. BOARD VIEW INTEGRATION

If the user is viewing tasks in **Board View**, the task card must show:

- Execution score indicator
- Importance level tag

Example card display:

Task Title

Execution: 8/10

Importance: High

---

8. ANALYTICS (Future Ready)

Structure the system so future analytics can include:

- Weekly execution score
- Monthly consistency score
- Task quality trends

---

9. USER EXPERIENCE

The system must encourage **reflection on task quality**.

The goal is not just task completion, but **how well the task was executed**.

This feature is a core part of the Consistency System philosophy.

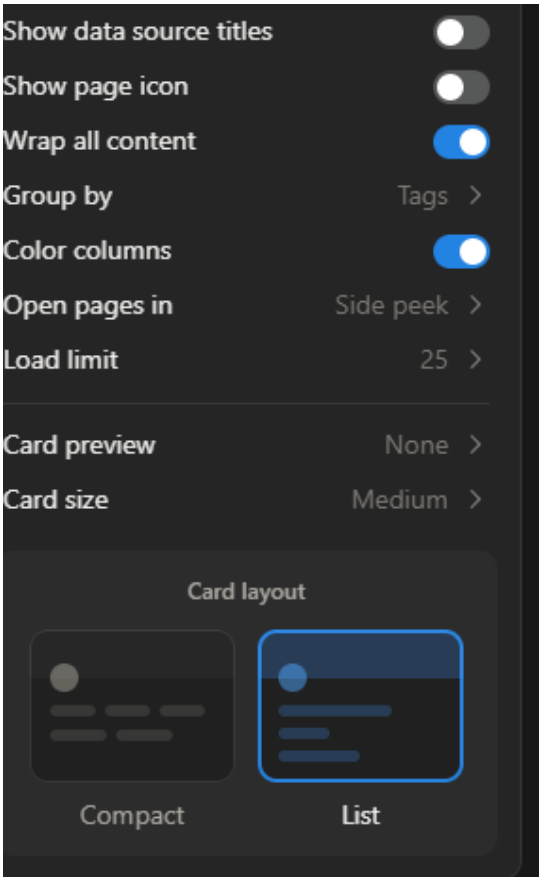
FINAL GOAL

Create a **Task Execution Scoring System** that allows users to evaluate the quality of their task completion using a 0–10 score, calculate daily averages, and visually track consistency and execution performance.

The above feature which u are looking at is the feature called board . please add this feature side of the feature of the TASK AND CALENDER .when people clikc the board this need to appear.

As u can similar feature as notion board task has it need also have similar features for our apps .

Make sure to make it like above and similar to all the features where notion has where w cna chage the oclour as u know the features notion has in this

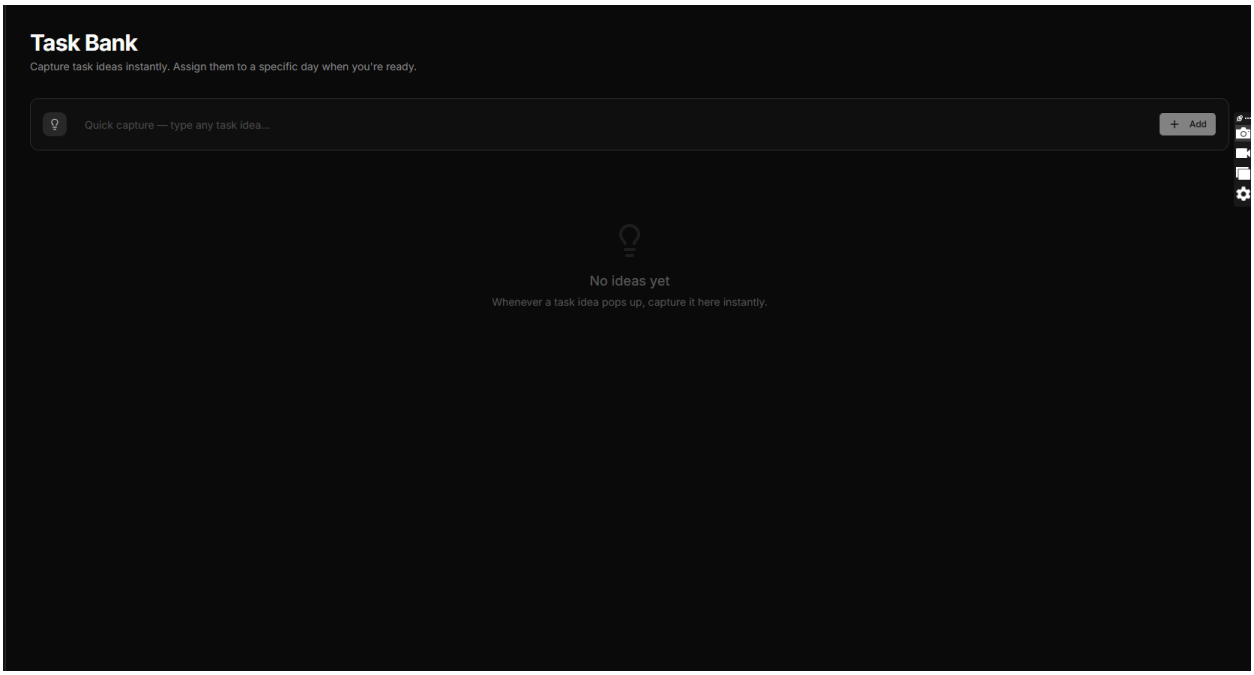


The above is the setings for the board make sure to include the above settings it is must make sure it need to be for sure the settings

Important Thing

One important rules is that as what people frequntly use that thing need to only appear when they click the daily task . for exmaple if any person uses Calnder than task or board then when they click the daily task that need to open defalut but the other 2 need to be side of it above

Task Bank Changes



in this feature basically there need to be an option where people can speak and task the task on any particualr day .

For exmaple people are busy and get a idea of though to do then they will speak like

xyz idea write down this on xyz day . so u need to make sure to write down at that particular day in the daily task . So it will be very easy for people to write down the task in that particular day

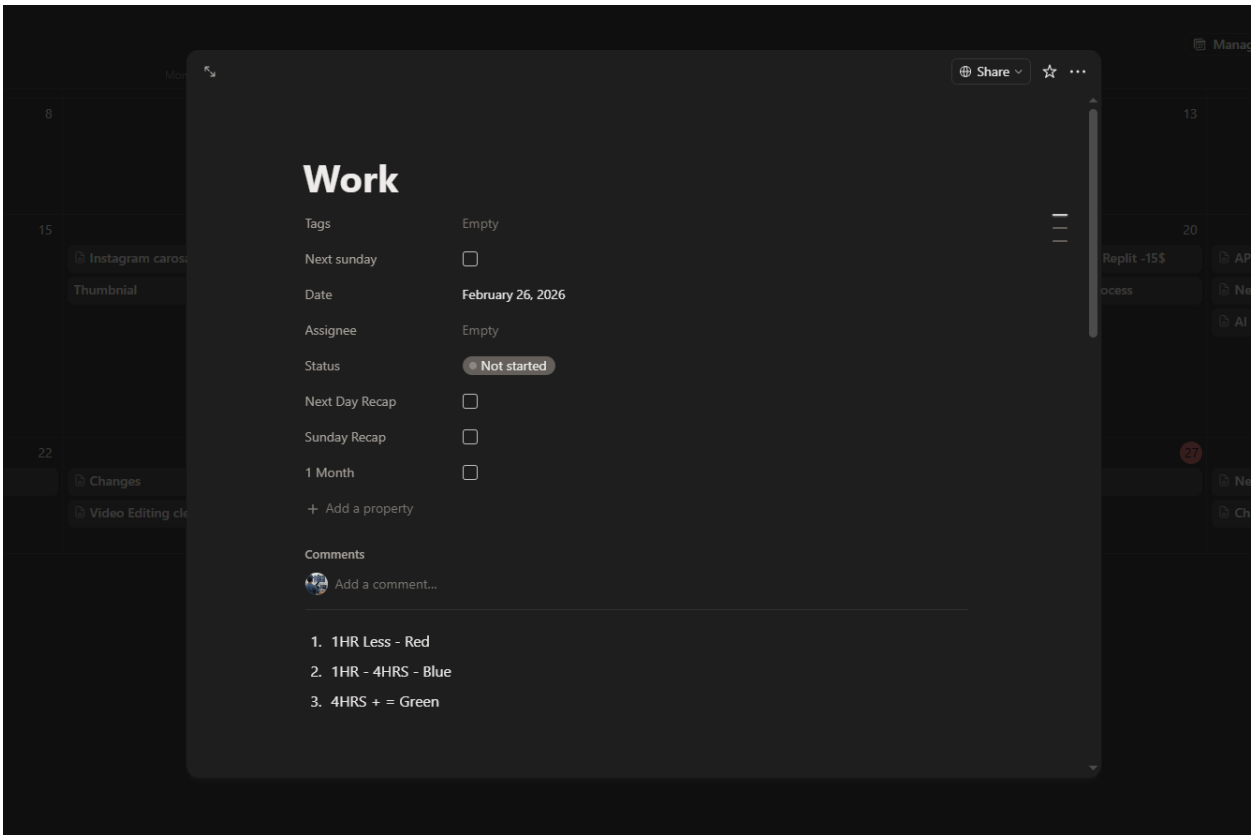
Not only that for exmaple if they as mark it ask important or according to that particular important level it need to mark and also description wirting too .

And also any thing which they write . Make sure to make this as professional as possbile

Another

- If people click on ADD then there need to be a task open to write not first writing then add . First people will click on ADD [Replace this with + Remove ADD]

1. People click on ADD
2. Then the task to write will appear
3. Then they will write down the task
4. If they clik that task there need a option need to get as Important level date and time and description but it need to look like this



Ramble Type feature which is in TODOLIST

Create a **Voice-to-Task feature** for the Consistency System application similar to the **Ramble feature in Todoist**.

This feature allows users to **speak naturally**, and the system automatically converts their speech into structured tasks.

FEATURE NAME

Voice Capture (Ramble-style)

---

1. LOCATION IN THE APP

Add a **microphone icon** in two places:

1. Next to the **Add Task button**
2. Inside the **Quick Add Task input field**

Example UI:

[+ Add Task] 🎤

When the microphone icon is clicked, open a **Voice Capture Panel**.

---

2. MICROPHONE ACCESS

When the user uses the feature for the first time:

- Request microphone permission
- Allow user to select microphone device
- Show recording indicator

Example UI:

Listening...

● Recording

---

3. VOICE CAPTURE SYSTEM

When recording starts:

The user should be able to **speak freely about multiple tasks**.

Example speech:

"Finish the Q1 roadmap draft by Tuesday afternoon, priority one, in the marketing project.

Also email the beta testers tomorrow at 8am.

That should take about 15 minutes."

The system should:

1. Record speech
2. Convert speech to text using speech recognition
3. Send text to AI parser
4. Extract structured tasks

---

4. SPEECH TO TEXT

Implement speech recognition using:

Web Speech API

or

Whisper speech-to-text API

Requirements:

- Real-time transcription
- Display text while user speaks

Example UI:

User speaking:

"Call supplier tomorrow morning"

Live transcription appears in text field.

---

5. NATURAL LANGUAGE TASK PARSER

After transcription, parse the sentence and extract task properties.

Example:

Input speech:

"Finish Q1 roadmap draft by Tuesday afternoon, priority one, marketing project."

Parsed task:

Task Title → Finish Q1 roadmap draft

Due Date → Tuesday afternoon

Priority → 1

Project → Marketing

---

6. TASK FIELDS TO EXTRACT

The system should detect the following fields from speech:

Task title

Project / category

Due date

Due time

Priority level

Labels / tags

Estimated duration

Deadline

Example voice input:

"Email beta testers tomorrow at 8am. Priority two. Should take 15 minutes."

Parsed result:

Title → Email beta testers

Date → Tomorrow

Time → 8 AM

Priority → 2

Duration → 15 minutes

---

7. MULTIPLE TASK DETECTION

The system must detect **multiple tasks from one voice session**.

Example speech:

"Finish marketing report by Friday.

Call supplier tomorrow morning.

Prepare meeting agenda tonight."

The system should automatically create **3 tasks**.

---

8. TASK REVIEW SCREEN

After parsing tasks, show a **Task Review Panel**.

Display tasks in editable list:

Task 1

Task 2

Task 3

Users can edit fields before adding them.

Buttons:

Add Tasks

Cancel

---

9. VOICE COMMAND CONTROL

Allow voice commands such as:

"That's all"

When detected, stop recording and show parsed tasks.

---

10. TASK DATABASE INTEGRATION

After confirmation:

Tasks must be saved into the **main task database**.

They must appear automatically in:

Task view

Board view

Calendar view

---

11. USER EXPERIENCE

Design principles:

- Fast capture of ideas
- Minimal typing required
- Clean voice interface
- Clear visual feedback

UI elements:

Recording animation

Live transcription

Editable task list

---

12. PERFORMANCE

Requirements:

Speech recognition must be:

- Fast
- Accurate
- Real-time

The system should handle **multiple tasks in one voice input**.

---

13. FUTURE EXTENSIONS

Design architecture so future features can include:

- Voice editing of tasks
- Voice completion scoring
- Voice task updates

Example:

"Change the email task to Friday at 8am."

FINAL GOAL

Create a **Ramble-style voice-to-task capture system** that allows users to speak naturally and automatically convert speech into structured tasks inside the Consistency System.

Audio Mic Option

- In every description there need to be option where what ever the infromation that we say it need to write down the information and not only the description are ain notes section too .
- Where every the scop where people will need of mic please place that so it will be easy for them to use
